Ignition 8.3

Dream Bigger.
Do More.

Developed for everyone from plant floor operators to IT managers and all the way up to executives, Ignition 8.3 has features for every architecture from single installation systems through advanced multi-site enterprises with cloud services. It meets you where you are on your journey so you can:

Manage more data, more easily

Create and customize better screens

Configure and launch projects more quickly

Orchestrate large systems with ease

**Protect your data with first-class tools**

Future-proof your processes

Do More with Data

Add Speed and Simplicity to Your Architecture With the Power Historian

Ignition 8.3 introduces a zero-configuration, self-maintaining, and — wait for it — built-in Power Historian that offers a new level of performance for local history collection. The Power Historian delivers blazing-fast storage and queries, excellent storage footprint, and improved data modeling so you can store data for your site simply and efficiently.
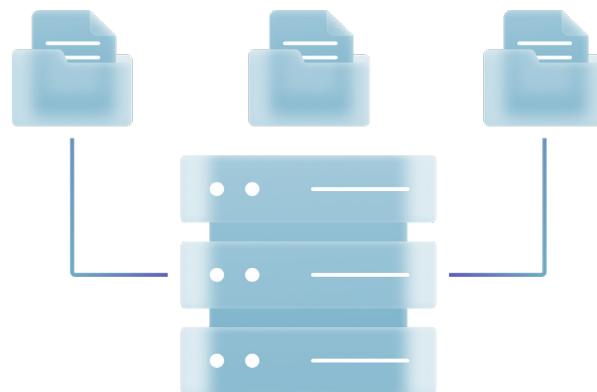

Ready Out-of-the-Box

It requires zero configuration so that you can use it in seconds.

Open & Cross-Platform

It uses open, platform-independent technology, so you aren't locked in.

Faster & More Powerful

The new Power Historian delivers faster queries and richer data modeling.

Create Your Own Historian With the New Time-series API

In Ignition 8.3, we've completely rethought our approach to time series history storage by creating a new, public API that allows module authors to implement their own new historians around any technology. The API supports bulk storage, streaming data collection, and storage and provision of rich metadata models. With this new API, Ignition isn't just a historian; it's a platform for building historians.

Handle Event Data With Ease With Event Streams

The Event Streams Module is a new and powerful way to handle event-driven data from a wide variety of sources. Event Streams opens a pipeline of communication between two seemingly disparate things: sources, such as a Kafka topic, and handlers, like scripts. With this module, sources and handlers don't need to know or understand the other in order to work seamlessly together, enabling you to direct your data with ease.
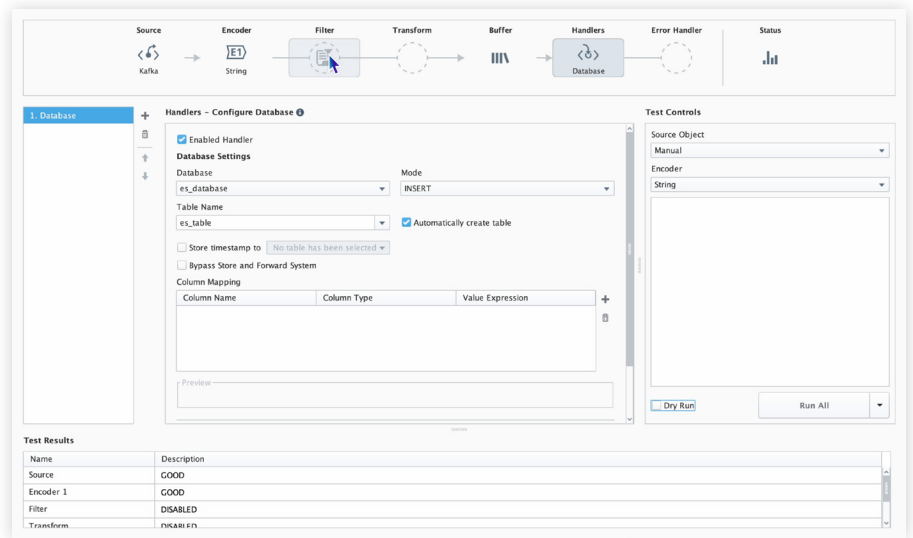

Centralize Events Management

Handle tag changes, database-related events, alarms, and other events from a central location — and centrally manage that event handling within the Ignition ecosystem.
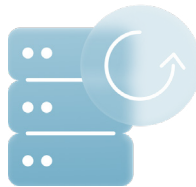

Subscribe to More Data

Leverage message queues, brokers, buses, and more to subscribe to data and trigger instant updates and notifications when it changes instead of relying on periodic polling.

Gain Flexibility for Your Data

Conveniently process data with Apache Kafka to use directly in applications in Ignition, pass it on to external sources, or employ a combination of both using Event Streams.

Keep Your Data Updated With Improved Store & Forward

Ignition 8.3 rolls out Store and Forward enhancements that increase the speed, accuracy, and visibility of data transfer. The overhaul boasts robust cache storage, improved parallel data forwarding, and intelligent table locking. New diagnostic tools for troubleshooting round out the improvements.

Create & Customize With Speed & Style

Design Graphics & Animations In Perspective With Native Drawing Editor

Designing dashboards, HMIs, and mobile-responsive screens with custom graphics in Ignition 8.3 is easy with the first-class vector illustration suite for the Perspective Module. These new native drawing tools add functionality and an intuitive Drawing Editor interface directly in the Ignition Designer.
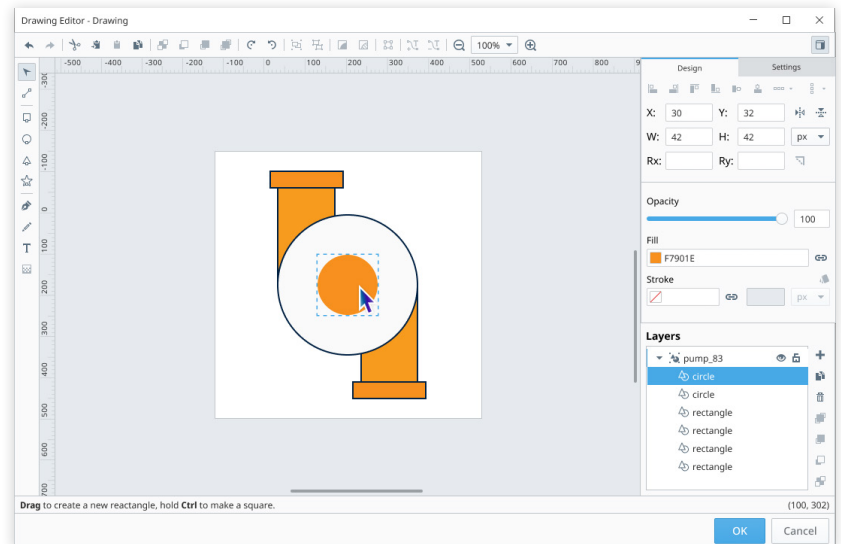

Edit and Design

Create and edit vector graphics directly in Perspective with intuitive controls that span the rich capability range of SVGs.

Bind to Tags

Bind any graphical element to dynamic sources such as tags directly from Perspective's drawing environment.

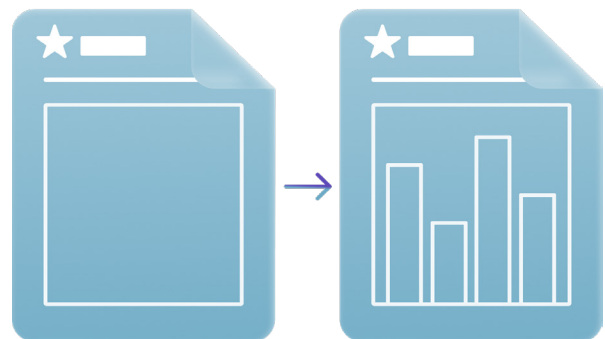

Add Animations

Add some life to your project by animating lines, shapes, groups of objects, and even layers of your graphics.

Reinforce Reports With Design Tools, Templates

Ignition 8.3 enriches the Reporting Module with even more charts for the visualization library and the ability to convert raster images into vector-based SVGs in reports. Plus, Master Page templates — including logos, headers, footers, and page number location — can be applied to ensure consistent design and format across all pages of a report.

Quickly Generate Forms in Perspective

Save design time using the new form generator in Perspective to create flexible forms you can customize. All you need to do is configure your sections, fields, and validation rules, and it will take care of building the form's layout, internal data logic, and client-side validation.

## Sync Data for Perspective Applications With Offline Mode

The Perspective Module has a new offline mode. This new feature enables users to enter project data on a mobile device from remote sites using the offline form, which will be uploaded and synced with your systems when reconnected.

Deploy & Manage More Effectively

Configure & Deploy Gateways Your Way

The Ignition Gateway is redesigned to make things easier to find and configure. Find what you're looking for quickly with a new user-friendly navigation structure and integrated search support. You can also easily manage all your connections and organize all your devices, profiles, and connectors with custom labels. With configuration and diagnostic data all in one place, managing everything is easier than ever.
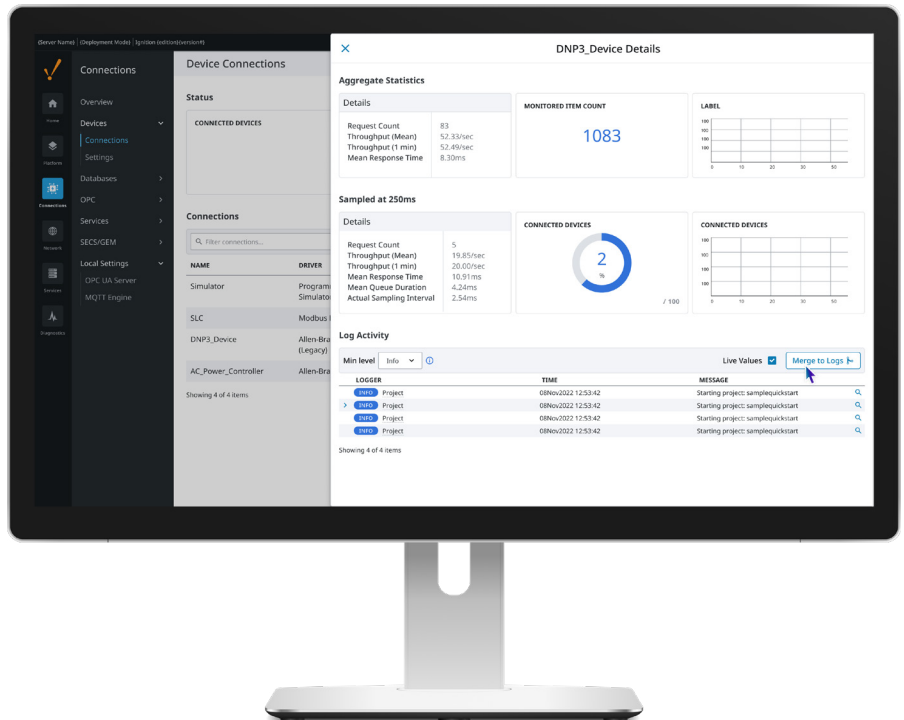

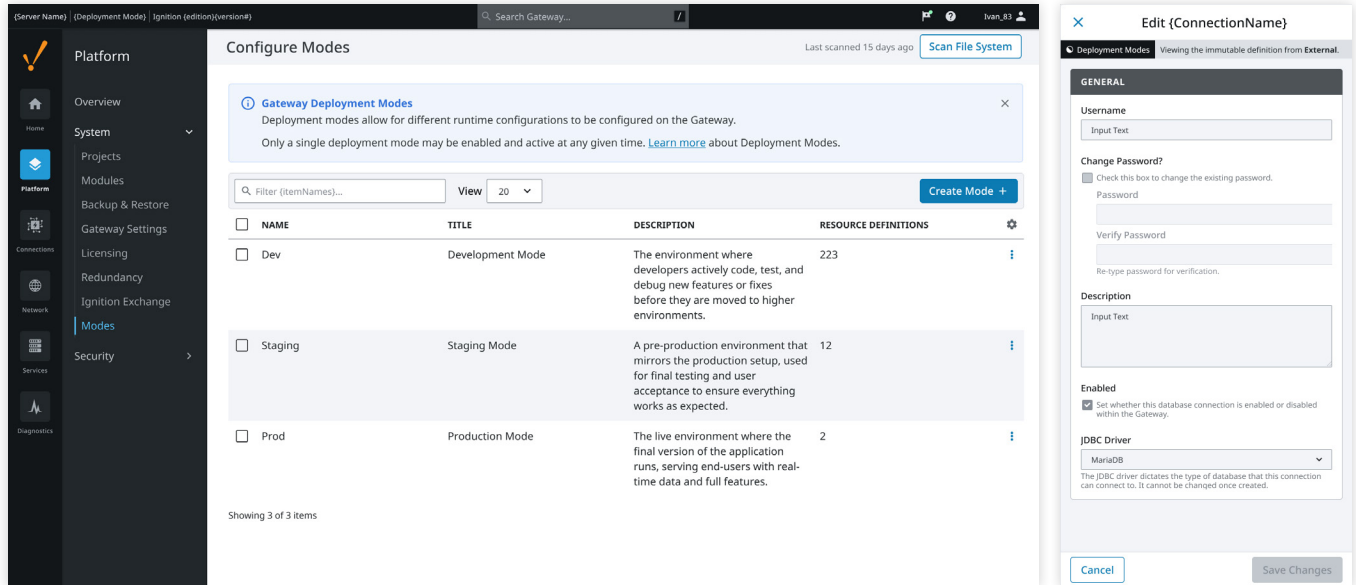

One-click Deep-link Launching

No need to waste time downloading files for large deployments in separate processes or windows. Deep link launching lets you open files for projects & designers right from the Gateway's homepage with a single click.
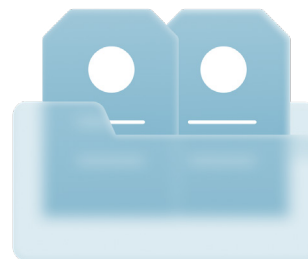

Build, Share & Secure Better With New File System

With Ignition 8.3, everything from gateway configuration and resources to tag definition and storage moves out of the internal database and into file storage for improved visibility and version control in all types of infrastructures and systems.

New Gateway-Wide Deployment Mode

Ignition 8.3's new Gateway-wide deployment mode allows you to create and define the configurations for multiple environments in a single Ignition server. With different environments built out for development, staging, and production, it's never been easier or safer to test, update, or make changes to your Ignition server.

Get With Git for Better Version Control & Collaboration

Ignition 8.3 is compatible with Git, a free and open-source distributed version control system (DVCS) that tracks changes in source code during software development. That means Ignition users have complete version control for a better way to collaborate and organize on big projects.

Secure Your System More Easily

Protect Data With Secrets Management

Secrets Management removes passwords, certificates, and encryption keys from Gateway configuration and safely stores and protects your private data. This feature also prevents unauthorized parties from accessing application infrastructure if configuration is shared. On top of that, 8.3 adds extensibility for integration with third-party secrets management platforms such as HashiCorp Vault.

State-of-the-Art Data Safety & System Security

Technical enhancements mean nothing if your systems aren't safe and secure. Ignition 8.3 is built to better protect your data and assets from vulnerabilities and threats.

Updated Gateway Technology

Ignition 8.3 boasts new serialization that improves the throughput of data for reliable, secure communication between gateways.
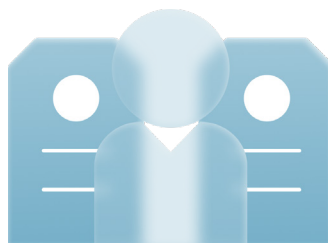

Share OPC Data on Your Terms

Pick and choose which users have access to which specific tags with the new OPC UA Roles feature.

Connect to More Things

Control Third-Party Access With OPC UA 1.05

With the latest OPC UA 1.05 specification, Ignition 8.3 provides greater integration and access control for device tags and exposed tags accessed by third-party OPC UA clients. With this, Ignition users can allow third-party access to select or specific devices, tag providers, or folders — and can control the read and write permissions granted with that access.
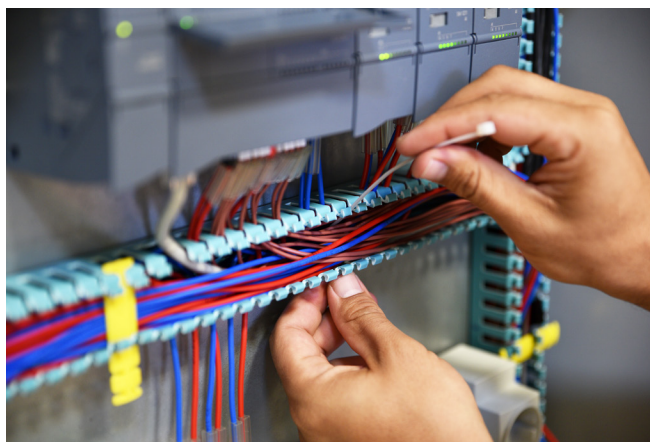

## Save Time With Siemens S7 Symbolic Driver

Ignition 8.3 updates the Siemens S7 driver with improved support for using Ignition with Siemens S7 PLCs for browsing, symbolic access, and access to optimized databases. This driver provides direct access to your device's I/O channels using function blocks that do not require manual mapping or reconfiguring of every connected device for each change.

Alarm Improvements: Get ISA-Compliant Stats, Alarms Over WhatsApp, and More

A new subscription-based Alarm Metrics aggregation model in Ignition 8.3 makes getting ISA 18.2-compliant alarm stats at the UDT or tag folder levels more efficient than ever. Plus, integrations for WhatsApp and Twilio Voice add VoIP messaging and text-to-speech capabilities to your alarm notifications within Ignition.

Future-Proof Your Processes
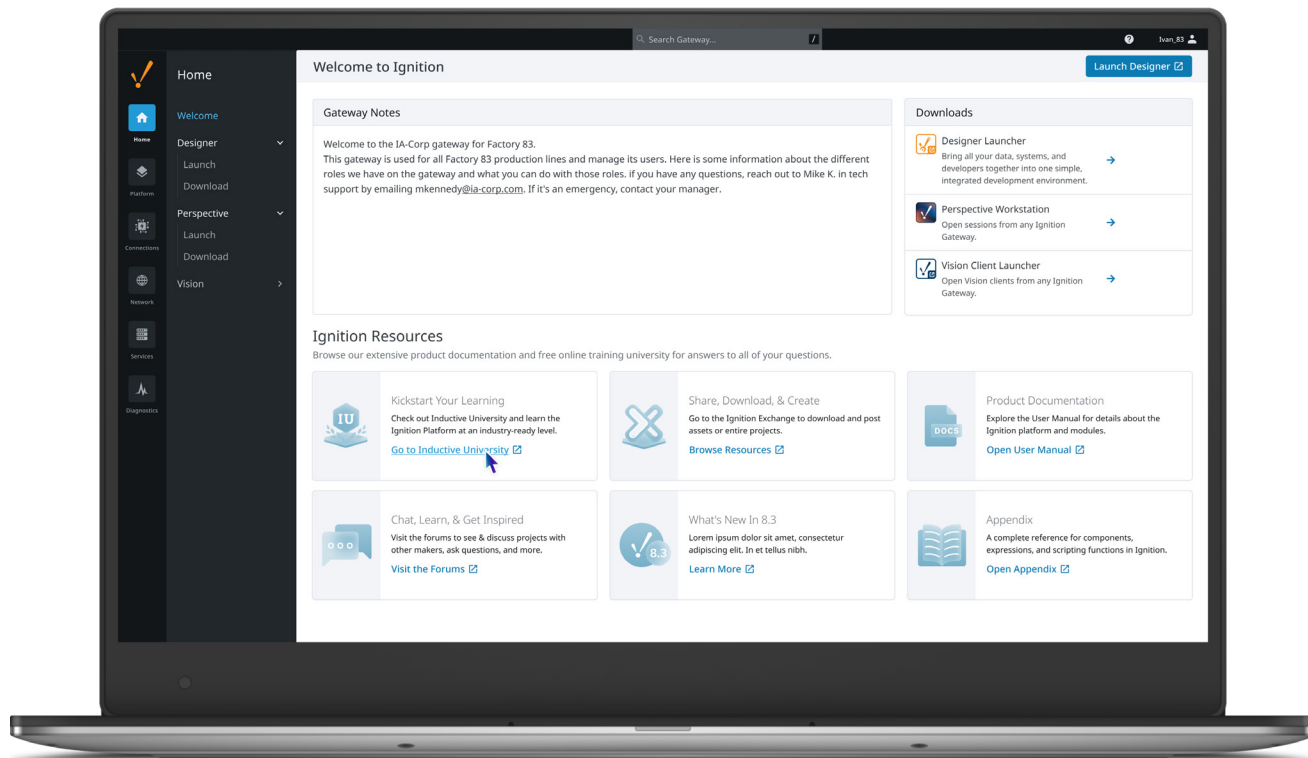

Long-Term Support

As a Long-Term Support (LTS) release, Ignition 8.3 will receive improvements and fixes for at least five full years from the date of release. Add a support plan with upgrade protection to stay up-to-date at no extra charge.

The Future Starts Today

Ignition 8.3 has the tools to improve your process today, and to build your system of the future. If you're ready to learn more, call us today.
